Summary

Frontend engineer with **4+ years** building web apps people actually rely on, from multi tenant SaaS tools to payment heavy marketplaces. I'm strongest on the frontend but ship **end to end**: backend APIs and data models, payment and third party integrations, and the CI/CD that puts it all in production. On my last platform I was the only engineer, owning every call from architecture to deploy. I care more about how something behaves for the user than how the component tree looks: fast to load, clean to scale, and steady when it counts. Now I want to do that kind of work on a product used by millions, where the engineering bar is high.

Skills

Core Stack	Next.js, React.js, AstroJS, TypeScript, JavaScript (ES2022+)
UI & Motion	Tailwind CSS, ShadCN UI, Material UI, Framer Motion, SCSS
Data & Backend	Supabase (RLS · Auth · Realtime), PostgreSQL, REST APIs
Payments	Stripe, JetPay, Authorize.Net, Razorpay (3 live integrations shipped)
Infra & Tools	Git, Docker, CI/CD, Cloudinary, Strapi, Mapbox, Ollama, MedusaJS
Architecture	SSR / ISR / SSG, RBAC, multi tenancy, component systems, Zod

Experience

Frontend Engineer

May 2022 – Present

WebForte Technologies Pvt. Ltd.

- Owned **3 client products end to end** as the sole engineer, working directly with clients to scope each one, then building everything from data models and APIs to the frontend and the deploy, with no senior engineer above me on the stack.
- Integrated **payment gateways** (Razorpay, Authorize.Net, Cash on Delivery) and third party services like Mapbox, Google DocumentAI, HubSpot and headless CMSs, scoping and building each one myself and handing it off clean.
- Automated the manual work that slowed clients down, from document intake to CRM onboarding and recurring billing, turning **hours of repetitive effort into minutes**.
- Streamlined releases with **CI/CD on GitHub Actions** and Docker, and turned auth, RBAC and API patterns into reusable modules so each new build started faster.

Projects

Honor Pet *Next.js 14 (App Router) · TypeScript · Supabase · WooCommerce · Authorize.Net · Redux*

Type: *Multi tenant SaaS for pet aquamation/cremation operations* **Live:** app.honor.pet

- Engineered a real time driver dispatch and route planning tool with **Mapbox GL** and the Mapbox Directions API, showing live driver locations over Supabase Realtime, color coded routes for each driver, and drag to reorder stops. Cut daily route planning by **~70%** and drive miles by **~15%** across **40+ pickups/drops a day**.
- Automated the paper intake process with a **Google DocumentAI** pipeline that reads scanned PDF forms and fills in the new pet record on its own, removing **~80% of the manual data entry** and dropping intake from **~5 minutes to under 1** per case across hundreds of forms a month.
- Architected a two way **HubSpot CRM** integration where an inbound webhook spins up a clinic the moment its intake form is signed and a durable job queue keeps each order's deal stage in sync with rate limit aware retries. Onboards new clinics in **minutes instead of ~2 days** and handles every deal stage update automatically across **120+ clinics**.

Delfee *Medusa v2 · Next.js 15 · Refine + Supabase · Razorpay · Shiprocket · DigitalOcean/Docker*

Type: *Full Stack Jewellery E-Commerce Platform* **Live:** delfee.in (store) · api.delfee.in (backend) · cms.delfee.in (CMS)

- Delivered the entire platform **solo**: storefront, admin dashboard, payments, shipping, GST billing and content system, owning every technical decision from data modelling and API design through to deployment. Acted as sole engineer and **de facto technical lead**, setting the architecture and patterns a full team could scale on.
- Captured revenue across every way customers like to pay, integrating **Razorpay** for UPI, cards and wallets alongside Cash on Delivery with a pay now, pay rest on delivery option. Added **GST compliant invoicing** with HSN codes plus recovery for abandoned carts and charged but unsaved orders, winning back sales that would otherwise slip away.
- Shipped an automated CI/CD pipeline on **GitHub Actions** for a monorepo holding all 3 apps that builds only what changed on each push, then deploys, runs database migrations and health checks before going live. Everything runs on a **single cost efficient server** with automatic HTTPS, keeping hosting cheap and pushing features live in **minutes**.

We Raise Funds *Next.js 13 (App Router) · TypeScript · Authorize.Net · Tailwind CSS · React Hook Form + Zod*

Type: *Multi tenant school fundraising & donation platform* **Live:** weraisefunds.org

- Built fast, SSR rendered fundraiser and seller pages with **Next.js 13** server components, injecting per page Open Graph and Twitter meta so shared links show rich previews. Added **QR code generation** with canvas to PNG download to power scan to donate and scan to register, plus one tap sharing to Facebook, X, LinkedIn and Telegram and SMS/email deep links, all across a **3 tier role hierarchy**.
- Engineered the donation flow on an **Authorize.Net** gateway, built around a dynamic **two tier fee engine** that recomputes live with cent precise rounding (flat or percentage), client side card validation with network detection, custom expiry handling, refunds, and real time financial KPIs across filtered orders.
- Architected a decoupled frontend that talks to a **Laravel REST backend** (~30 endpoints) over token authenticated fetch (Bearer tokens, CORS), mixing server side fetching for public SEO pages with client side fetching for dashboards, on top of SEO first nested dynamic routing that gives each seller its own donation funnel via App Router route groups.

Education

B.Tech, Computer Science

2014 – 2018

Kurukshetra University, Haryana
